

F5 Reliability on the val split. Bins uniform in log-odds (30 bins, $p \in [1e-5, 0.99999]$); dotted line is perfect calibration. Shaded bands are Wilson intervals; shaded columns are the audited region $[0.01, 0.99]$ and, darker, the threshold view $[0.01, 0.5]$. Bin edges are fixed constants shared by every curve.
